AS A LOGGED-IN USER, I SHOULD BE ABLE TO:
Write and submit a review for an item that includes
- ☐ A written text review
- ☐ A score/rating
- ☐ Only one review should be allowed per item, per user
- ☐ View a list of all reviews I have written.
- ☐ Delete reviews I have written.
- ☐ Edit reviews I have written.
- ☐ Change the text review.
- ☐ Modify the score/rating.
- ☐ Write comments on reviews written by others.
- ☐ View a list of all comments I have written.
- ☐ Edit and delete my comments.

AS AN ADMINISTRATOR, I SHOULD BE ABLE TO:

- ☐ View a list of all reviewed items.
- ☐ Add, edit, and remove reviewed items.
- ☐ Normal users should not have this ability.
- ☐ Two REQUIRED pieces of information for each item:
- ☐ Category or Tag:
- ☐ For example:
- ☐ Restaurants might be tagged as burger, pizza, Indian, Chinese, etc.
- ☐ Books might fall under sci-fi, romance, mystery, etc.
- ☐ Picture:
- ☐ At least one picture representing the item (restaurant photo, book cover, etc). This can be a link to a picture hosted either on your site or elsewhere on the Internet.
- ☐ Administrators should be able to add and modify relevant information on an item. It is up to you to decide what information is relevant, necessary, or otherwise. For example:
- ☐ Books might have Title, Author, ISBN, Publisher, Published Date, Edition, and Language, where all fields except Title and Author are optional.
- ☐ Restaurants might have Name, Address, Phone Number, Website, Instagram Account, and Operating Hours, where all fields except Name and Address are optional.
- ☐ View a list of all users.
- ☐ The administrator view for each user should include the users':
- ☐ Role (user or administrator)
- ☐ Email address (should be unique)
- ☐ Any other relevant information (name, review count, etc.)

AS AN ENGINEER, I SHOULD

- ☐ Have a well-seeded database so that I can simulate several different scenarios for the user stories below.
- ☐ By doing this, you set yourselves up to tackle many of the points throughout the tiers. In the long run, this will potentially save you tons of time.
- ☐ For example, seed hundreds of items and reviews with dummy data so that when you get to the "pagination" user story, you won't have to worry about adding more.
- ☐ Also, add a bunch of users with reviews so the review editing features can be worked on without already having the "write a review" functionality built.
- ☐ Have secured user data so that no one can unrightfully manipulate information.
